ENTITY RELATIONSHIP MODELLING

Fsoft Academy

Lesson Objectives

01 Understand an overview of the basic RDBMS Concepts

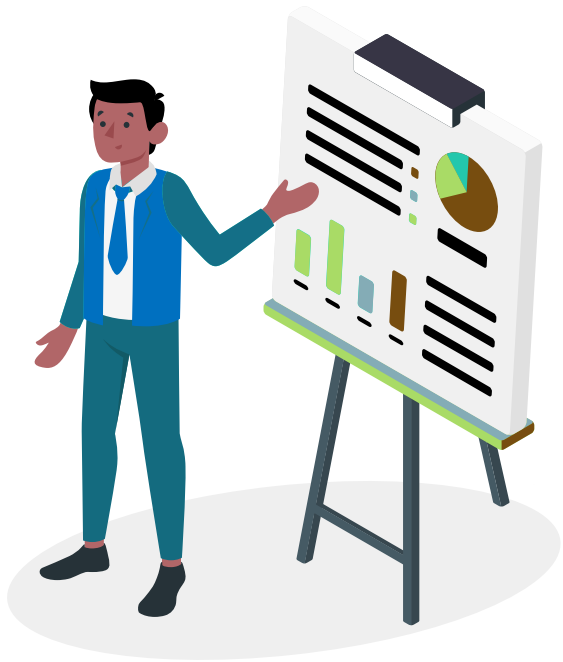
02 Understand an insight into the architecture and components of a Database System.

03 Describe how entities, attributes and relationships are used to model data;

04 Converting ER Model to relational schema

Agenda

1. SQL Overview
2. The Relational Database
3. The Relational Database
4. ER Model



Section 1

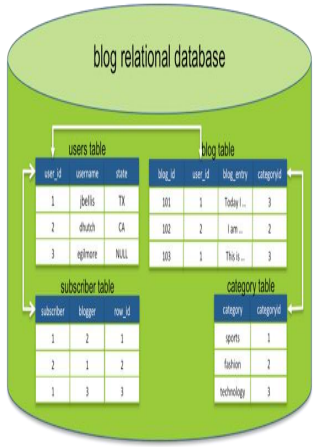
SQL Overview

What is SQL?

Structured

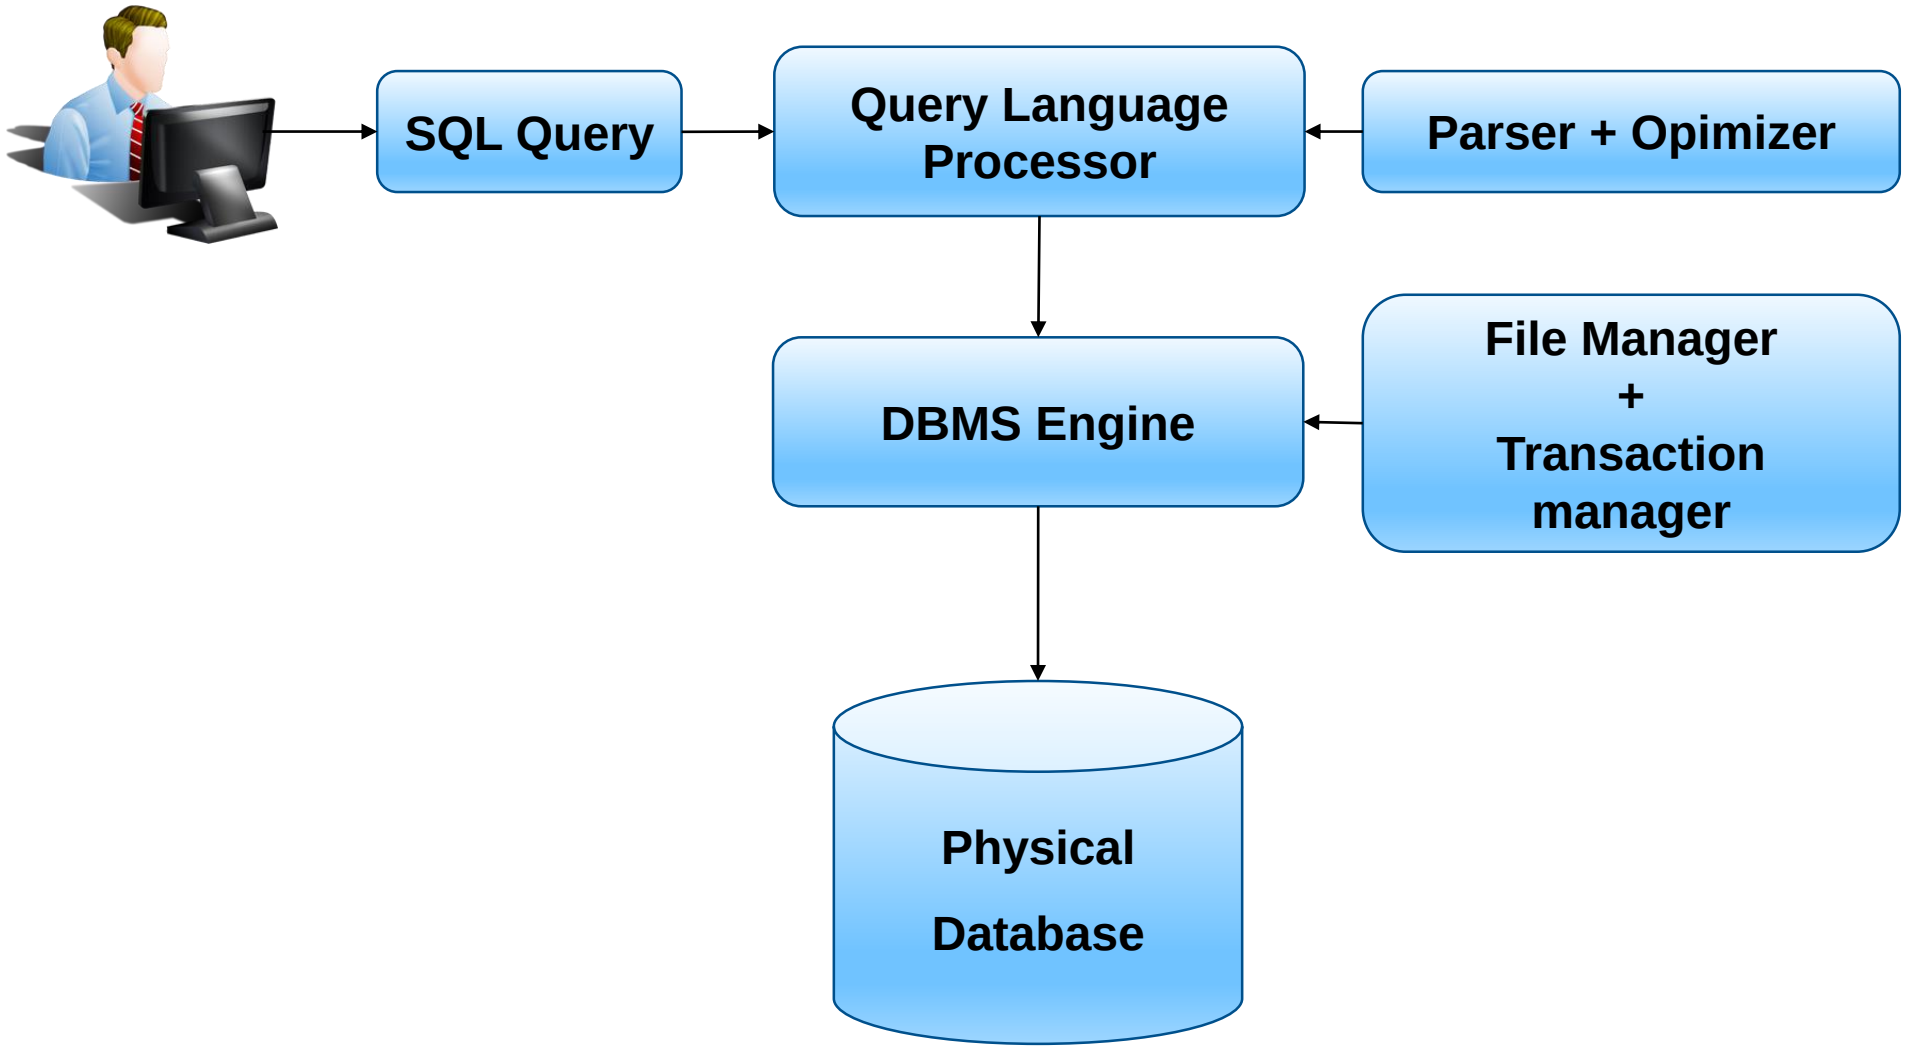
Query

Language



- **Which is a computer language for:**
  - ✓ storing,
  - ✓ manipulating and
  - ✓ retrieving data stored in relational database.
- SQL is the standard language for Relation Database System, like **MySQL**, **MS Access**, **Oracle**, **Sybase**, **Informix**, **Postgres** and **SQL Server** use SQL as standard database language.
- SQL is an ANSI (American National Standards Institute) standard.

SQL Process

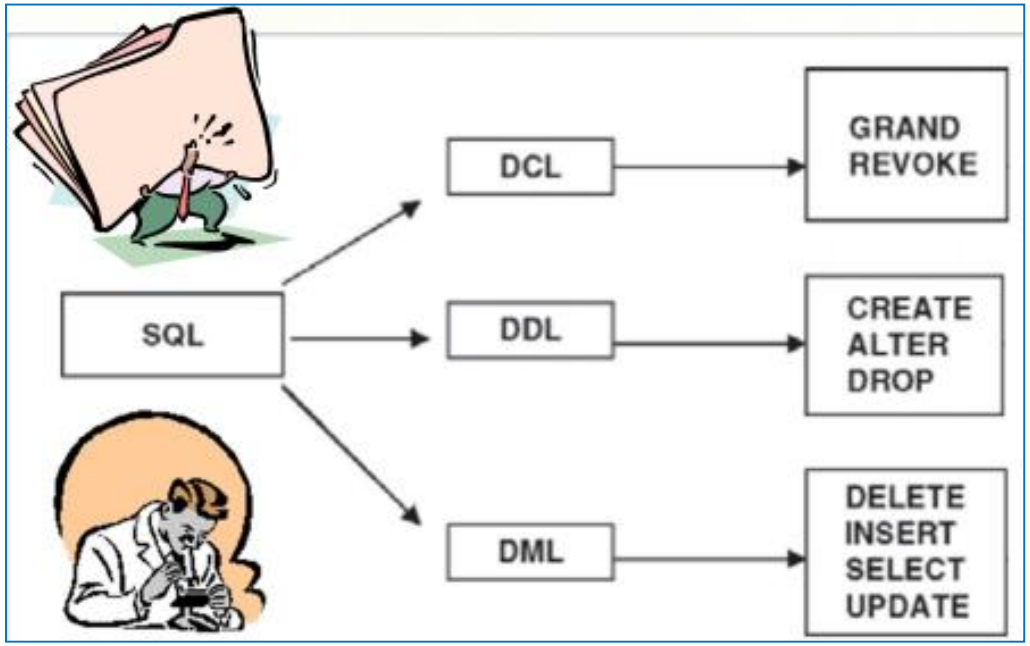


SQL Query
Query Language Processor
Parser + Opimizer
DBMS Engine
File Manager + Transaction manager
Physical Database

SQL Commands

SQL consists of **three components:**

- Data Definition Language (DDL)
- Data Manipulation Language (DML) and
- Data Control Language (DCL)

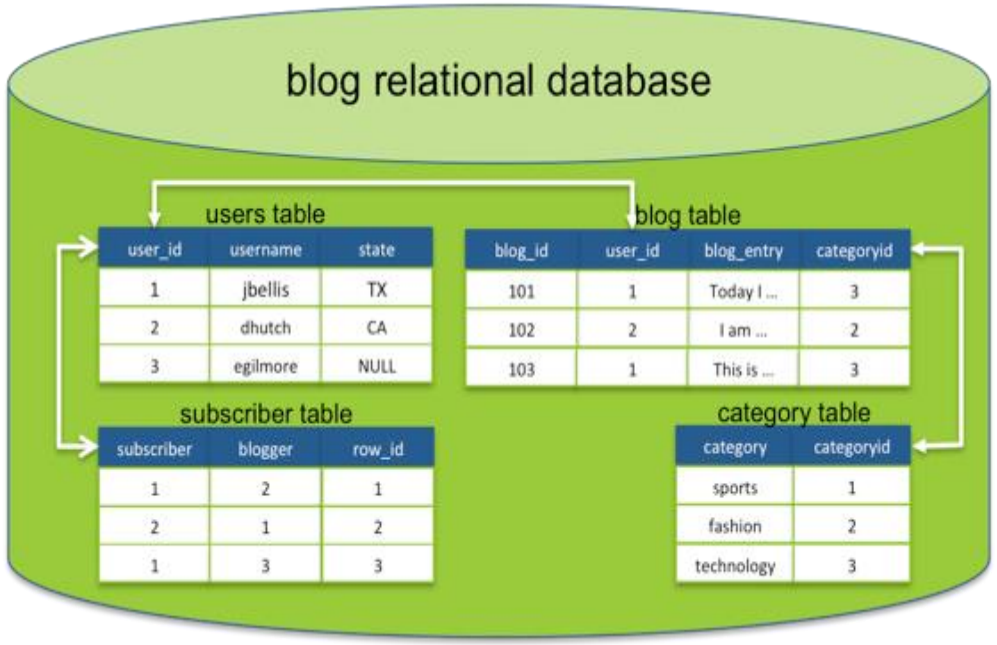


Section 2

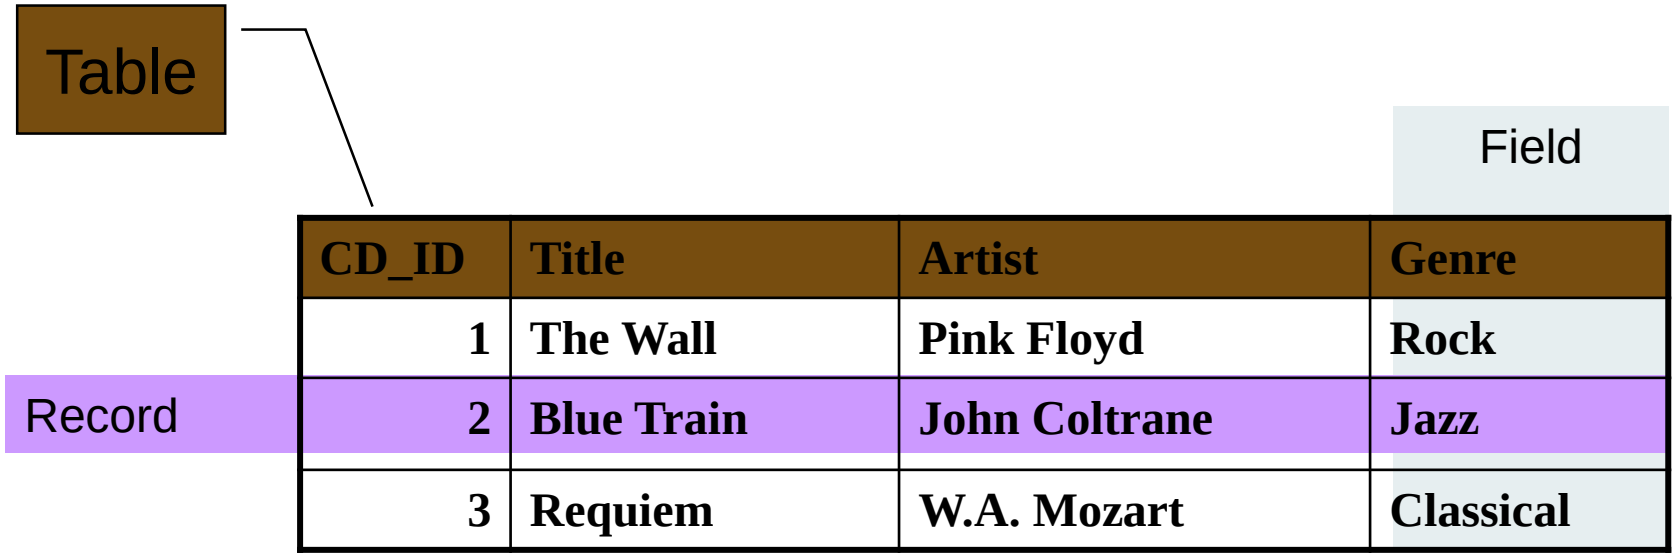
The Relational Database

Relational Database Concepts (1/3)

- "A DBMS that manages data as collection of **tables** in which all data relationships are represented by common values in related tables."
- "A DBMS that follows all the twelve rules of CODD is called RDBMS"

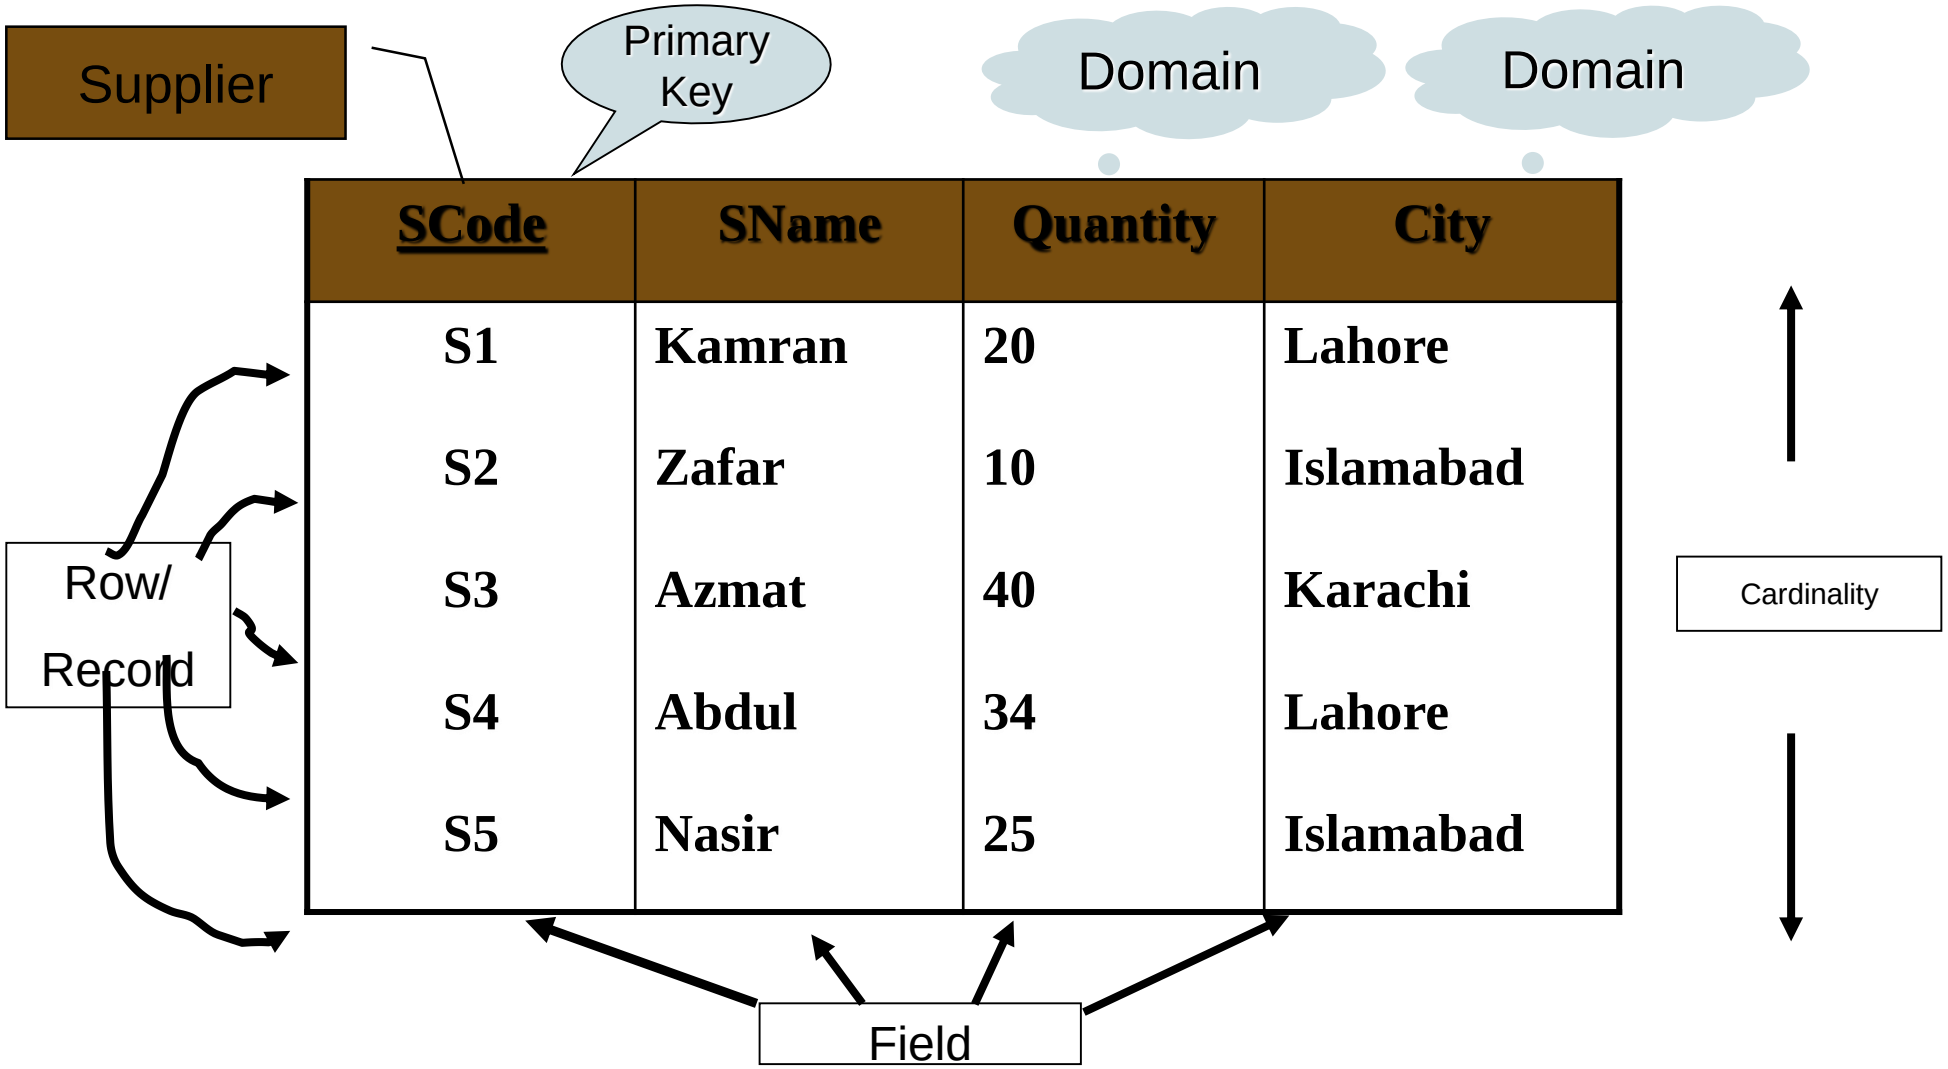


Relational Database Concepts (2/3)



CD_ID	Title	Artist	Genre
1	The Wall	Pink Floyd	Rock
2	Blue Train	John Coltrane	Jazz
3	Requiem	W.A. Mozart	Classical

Relational Database Concepts (3/3)



Schema (1/2)

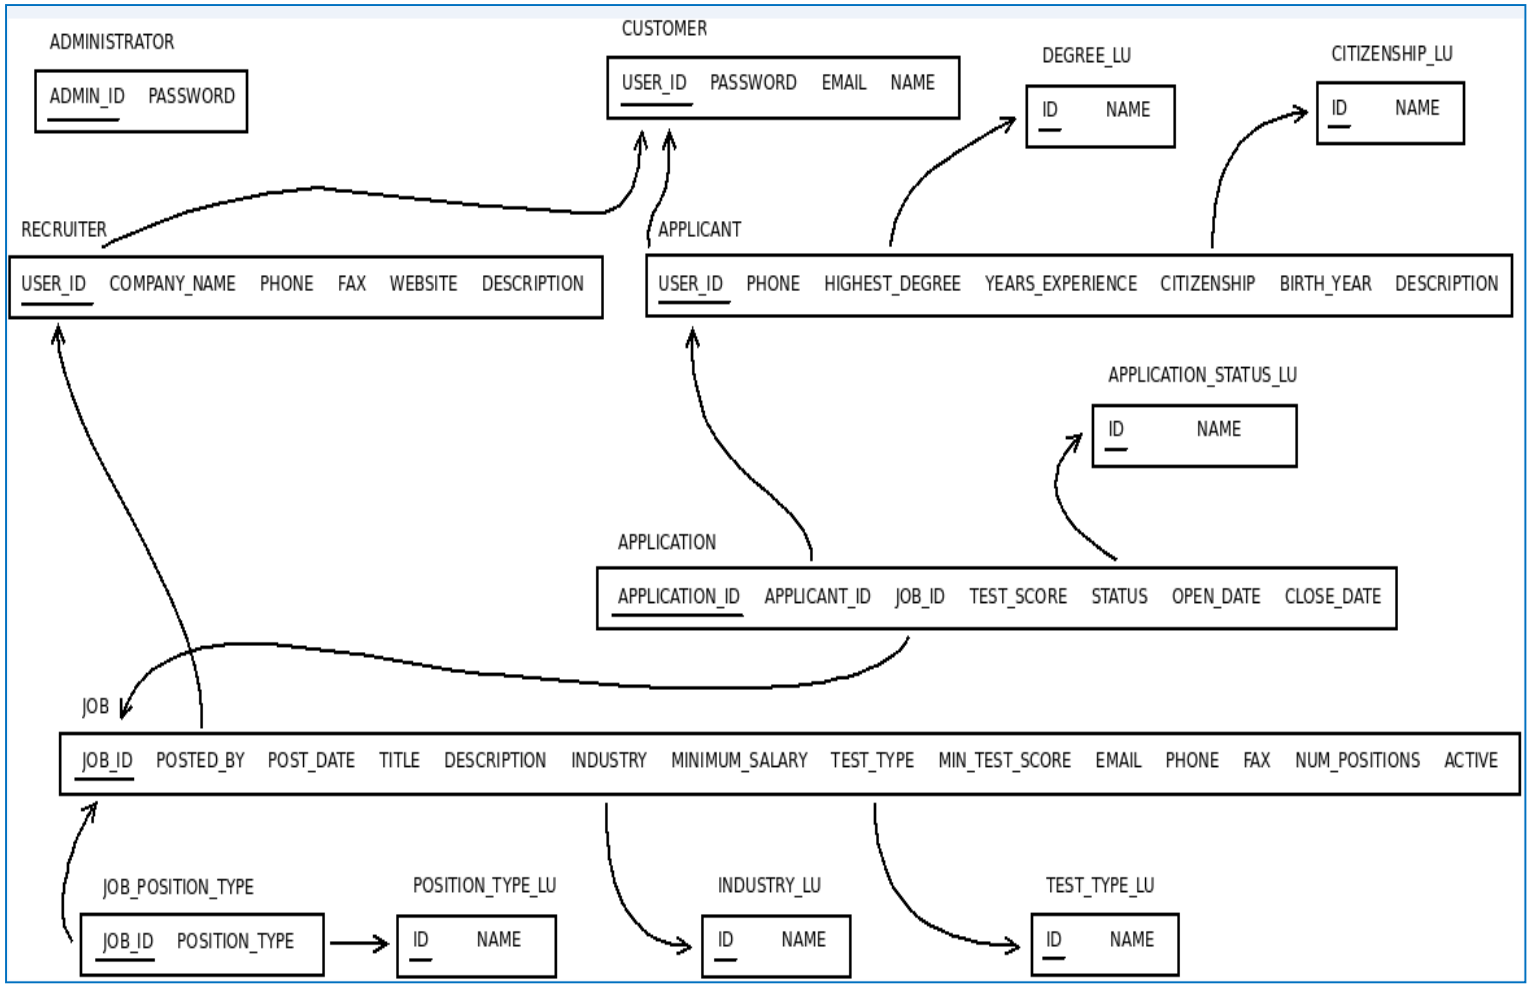
- The name of a relation and the set of attributes for a relation is called a **schema**.
  - ✓Example: the schema for previous slide is

Supplier (SCode, SName, Quantity, City)

- **Relation schema** = name(attributes) + other structure info., e.g., keys, other constraints.
- Order of attributes is arbitrary, but in practice we need to assume the (*standard*) order given in the relation schema.
- **Relational database schema** = collection of relation schemas.

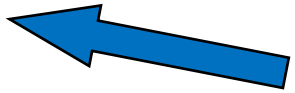
Schema (2/2)

- **Relation schema example:**



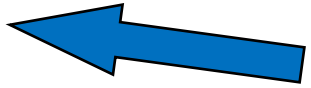
Schema versus Instance

Student(studno,name,address)
Course(courseno,lecturer)



Schema

Student(123,Bloggs,Woolton)
(321,Jones,Owens)



Instance

sid	Name	Login	age	GPA
53666	Jones	Jones@ca	18	3.4
53444	smith	Smith@ecs	18	3.2
53777	Blake	Blake@aa	19	3.8

số hàng

arity: số lượng cột

➔ Cardinality = 3, arity = 5 , all rows distinct

➔ Do all values in each column of a relation instance have to be distinct?

What is RDBMS?

- **RDBMS** stands for:

  Relational **D**atabase **M**anagement **S**ystem

- **RDBMS** is the basis for SQL, and for all modern database systems like:
  - ✓ MS SQL Server,
  - ✓ IBM DB2,
  - ✓ Oracle,
  - ✓ MySQL,
  - ✓ and Microsoft Access.
- A Relational database management system (RDBMS) is a database management system (DBMS) that is based on the relational model as introduced by E. F. Codd.

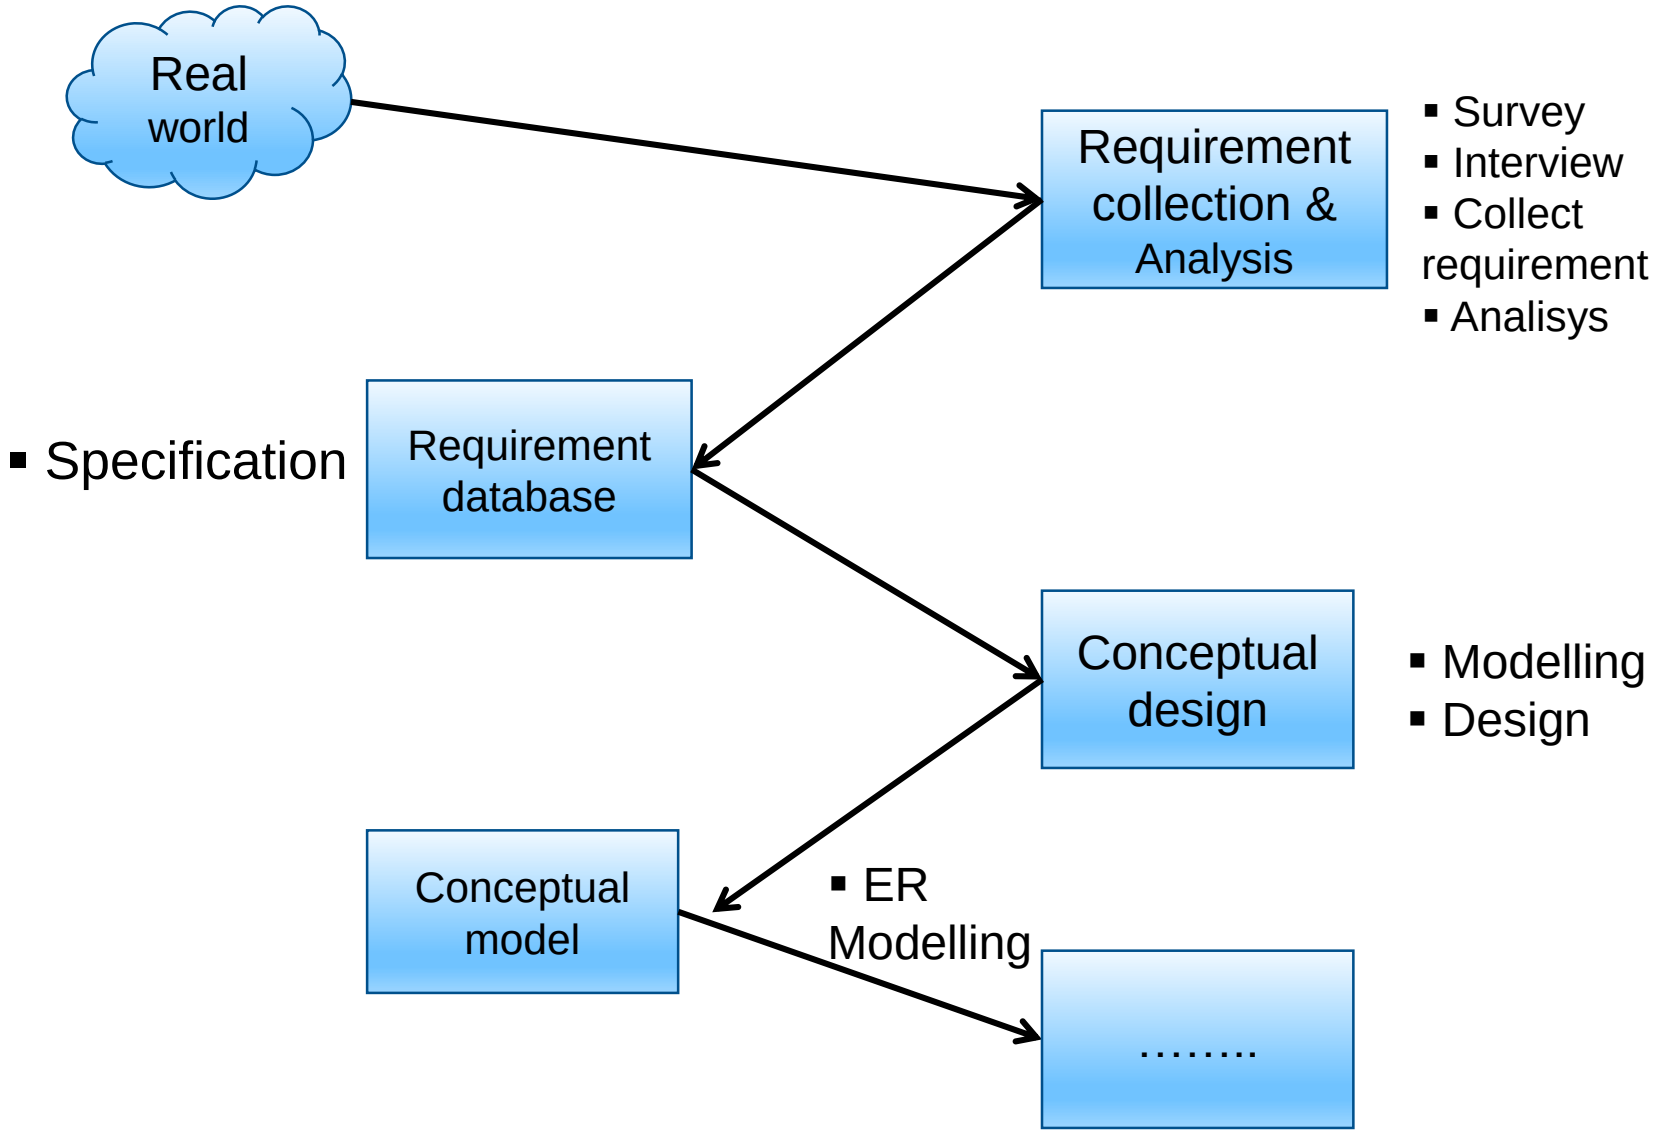
DBMS vs. RDBMS

DBMS	RDBMS
The concepts of relationships is missing in a DBMS. If it exits it is very less.	It is based on the concept Of relationships
Speed of operation is very slow	Speed of operation is very Fast
Hardware and Software requirements are minimum	Hardware and Software requirements are High
Platform used is normally DOS	Platform used can be any DOS, UNIX,VAX,VMS, etc
Uses concept of a file	Uses concept of table
DBMS normally use 3GL	RDBMS normally use a 4GL
Examples are dBase, FOXBASE, etc	Examples are ORACLE, INGRESS, SQL Server 2000 etc

Section 3

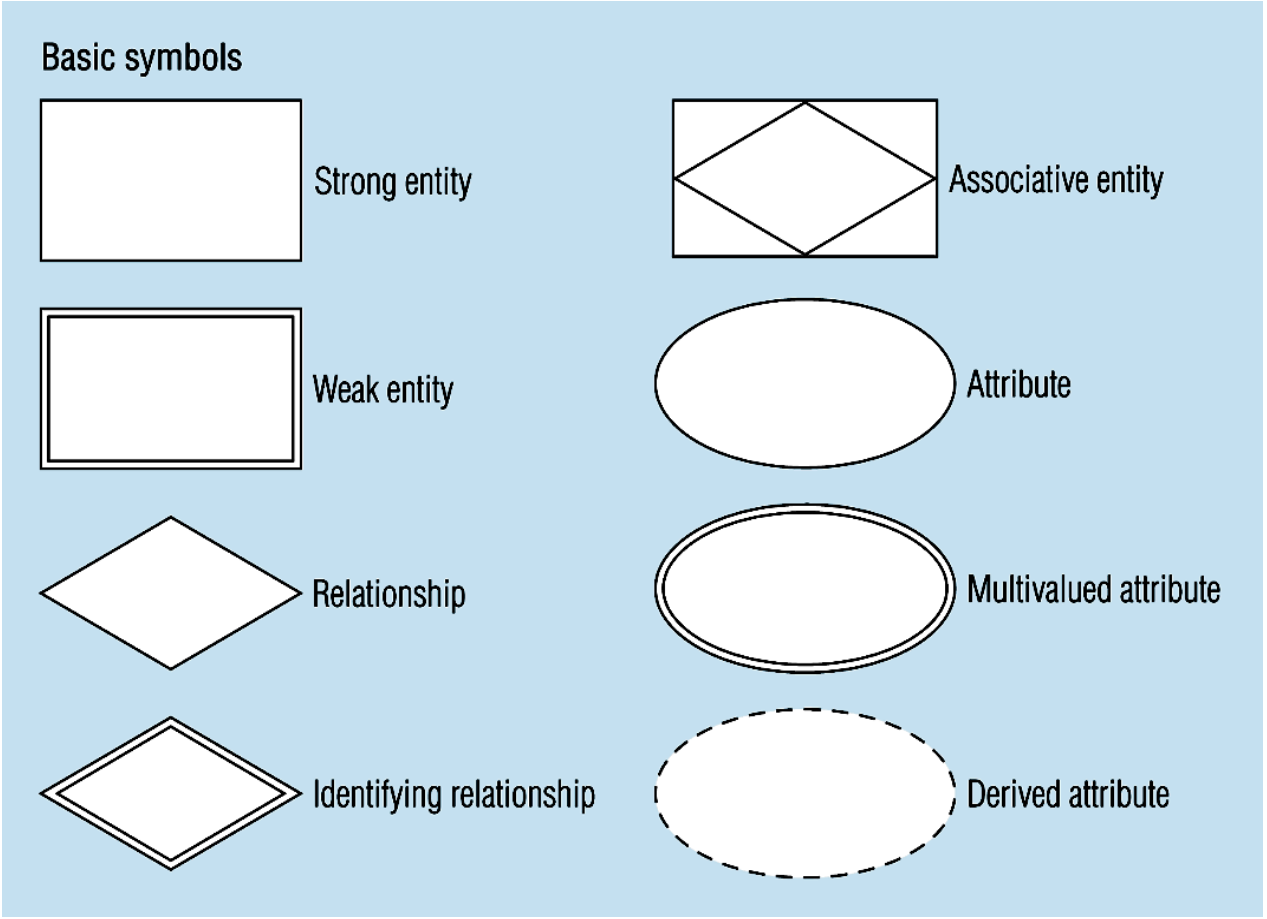
ER Model

Design Process



Basic E-R Notation

Entity symbols



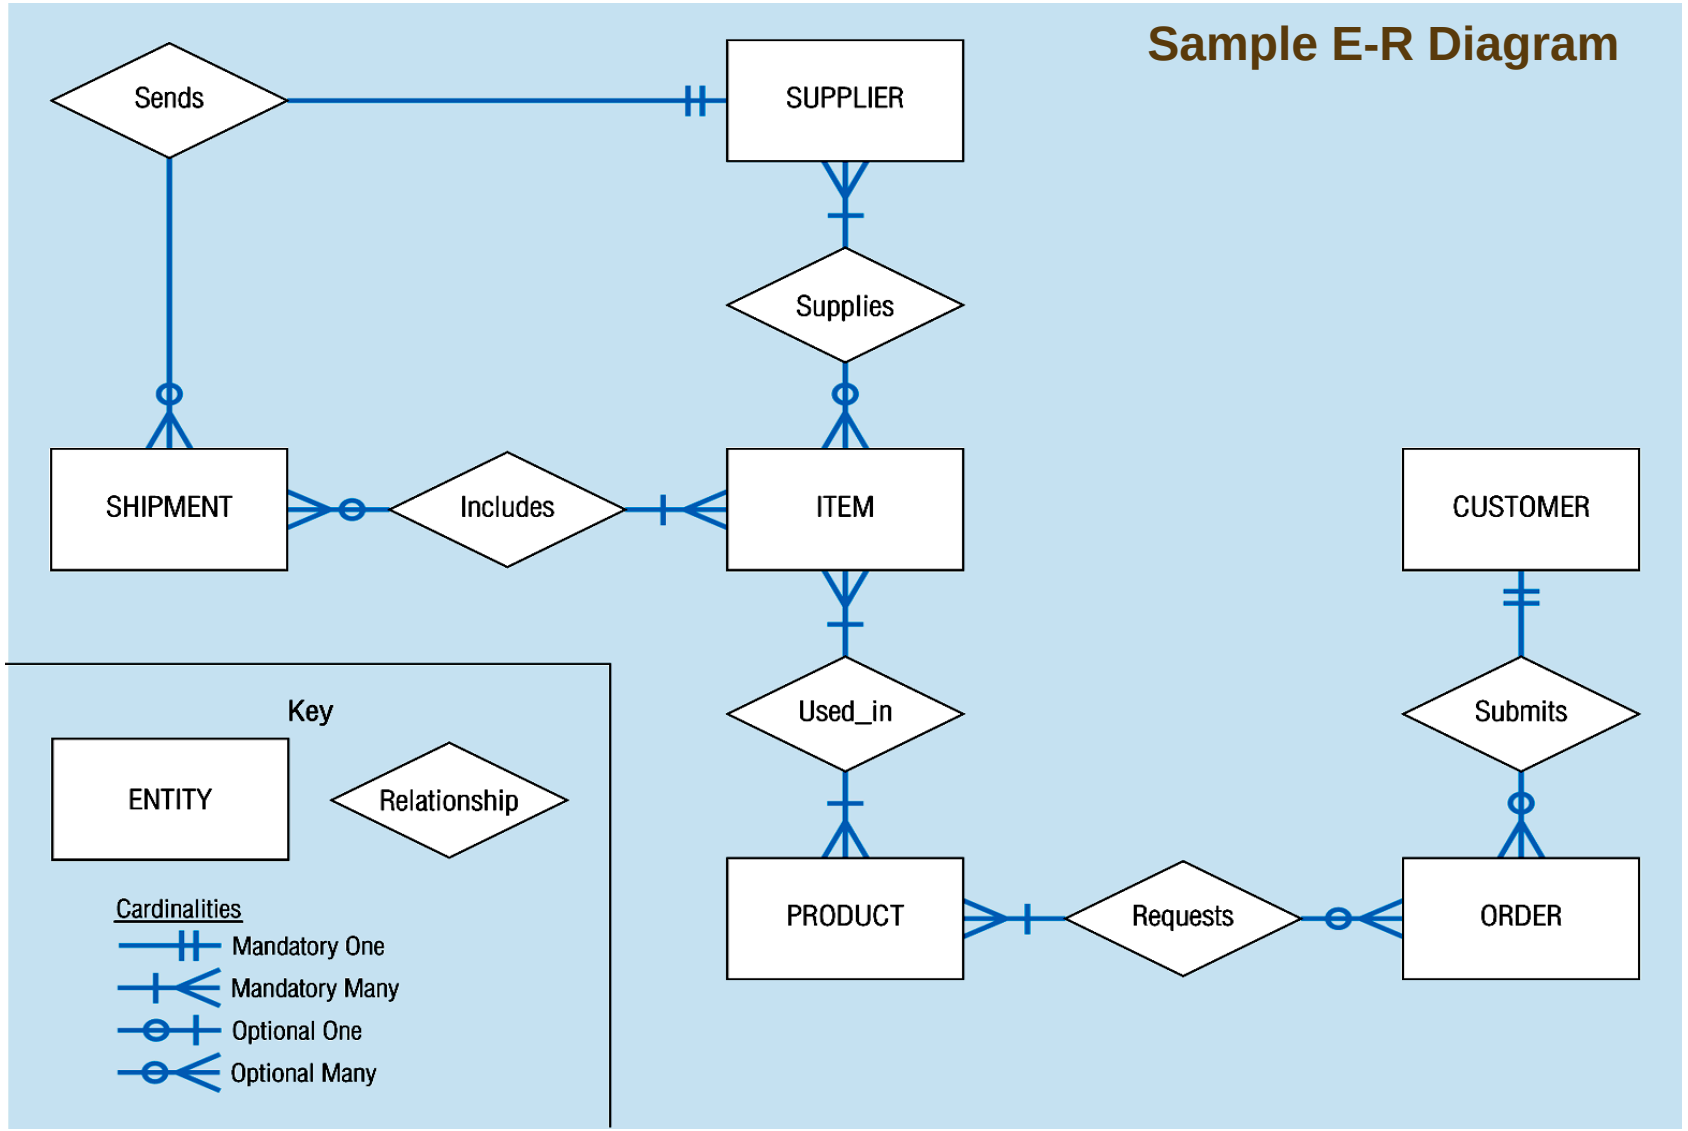
A special entity that is also a relationship

used to resolve many-many relationship into 2 one-to-many tables

Relationship symbols

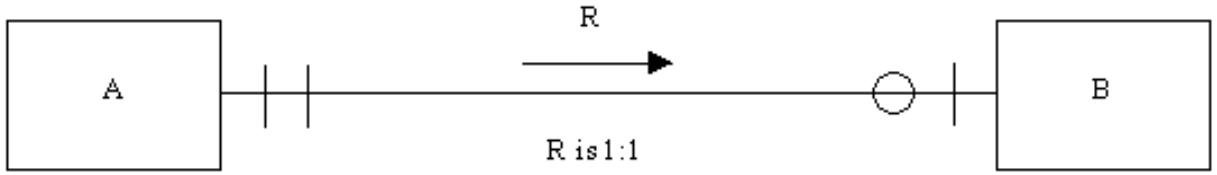
Attribute symbols

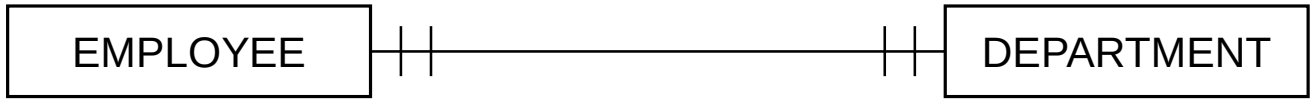
ER Model Overview



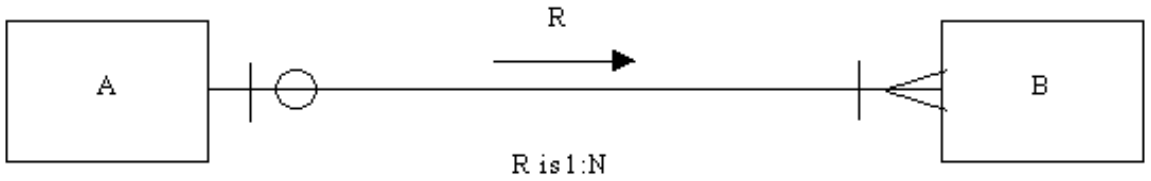
Cardinality of Relationships (1/2)

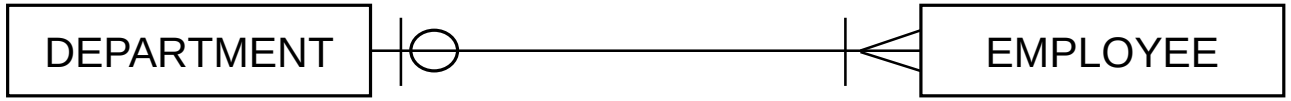
- One – to – one:





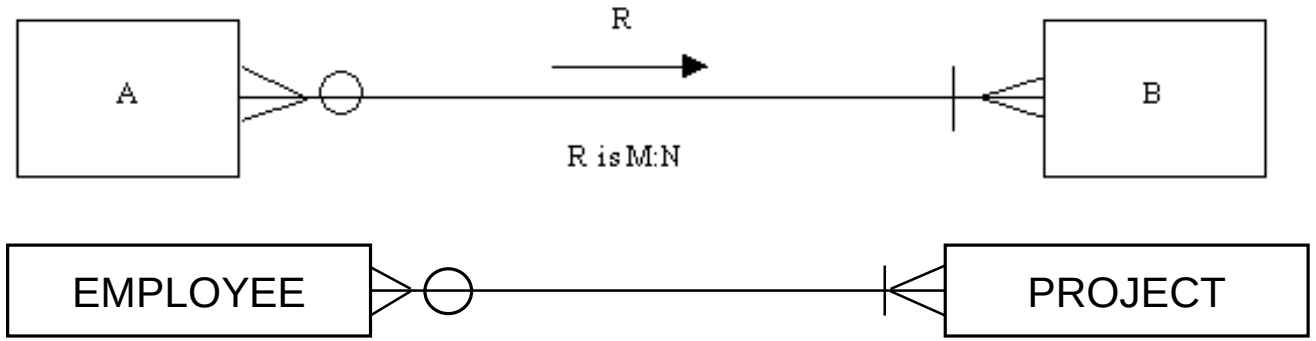
- One – to – many:



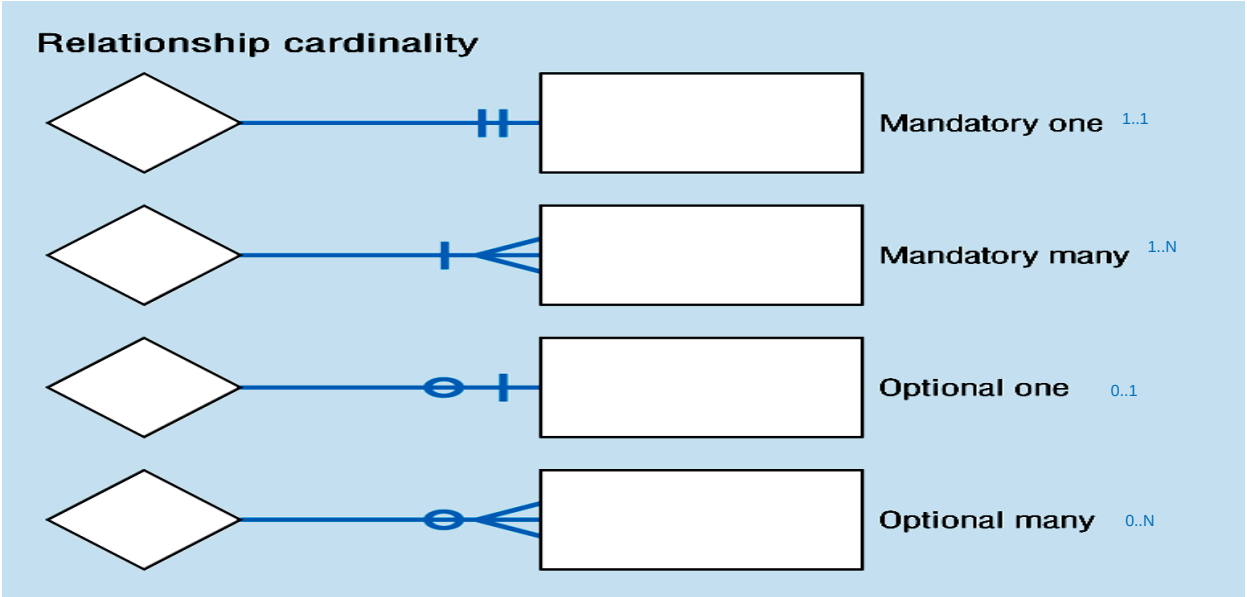


Cardinality of Relationships (2/2)

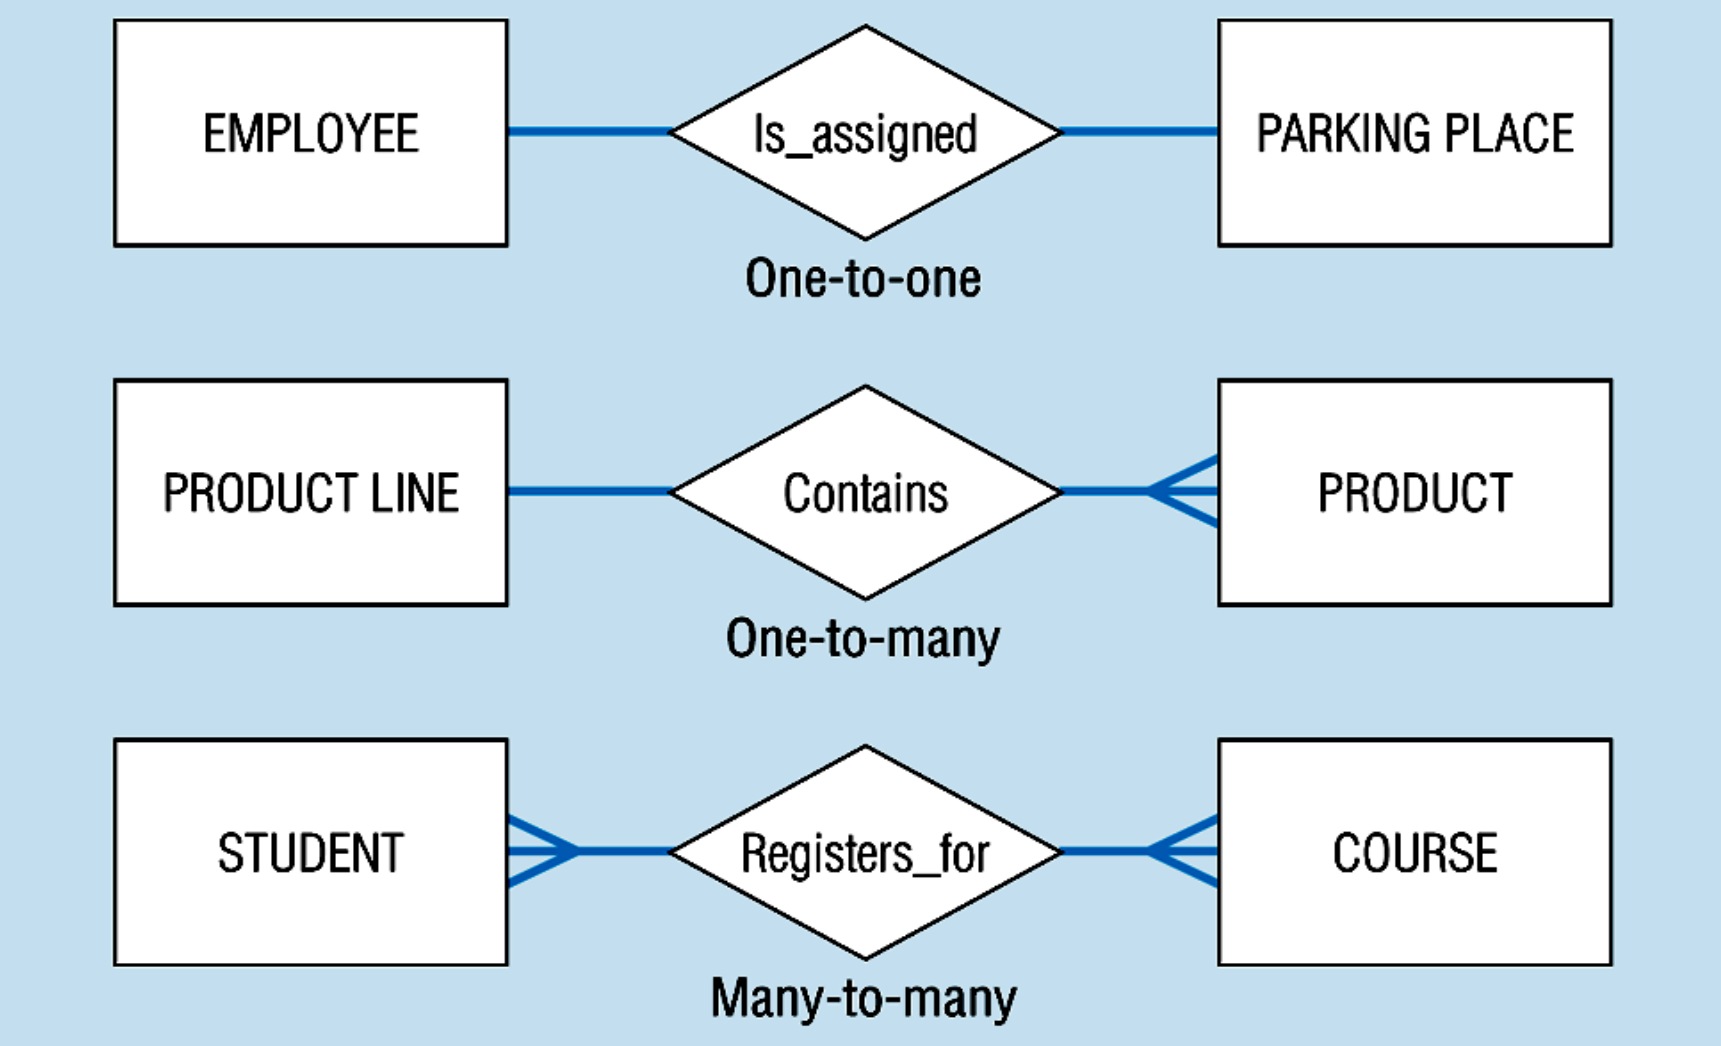
➢ **Many – to – many:**



❖ **In which:**

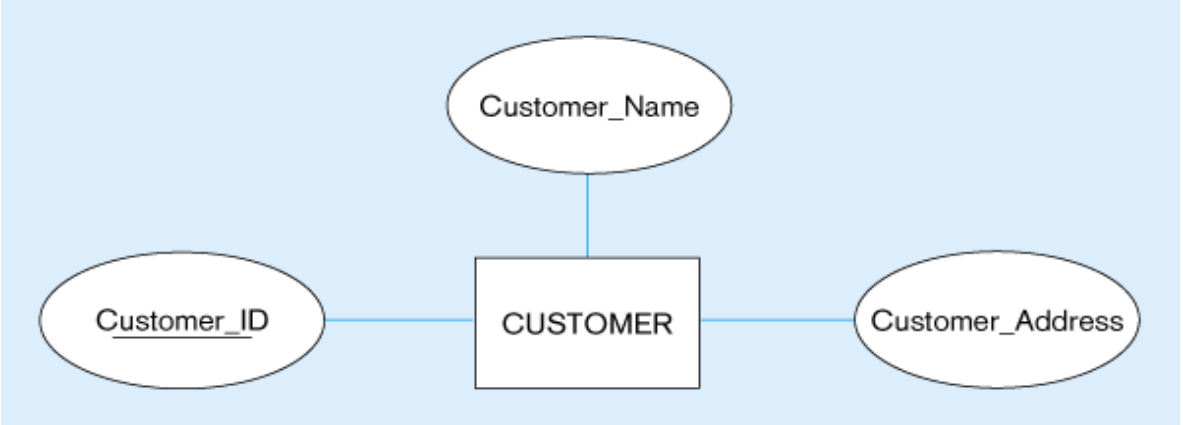


Binary relationships

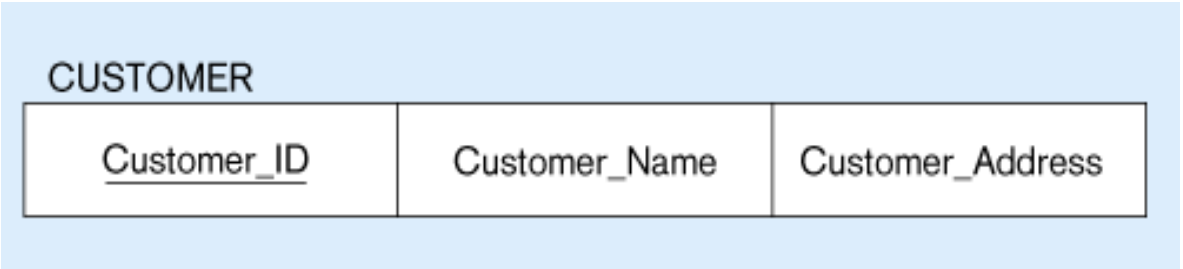


Converting ER Model to relational schema

Rule 1 - Convert entity type with simple attributes



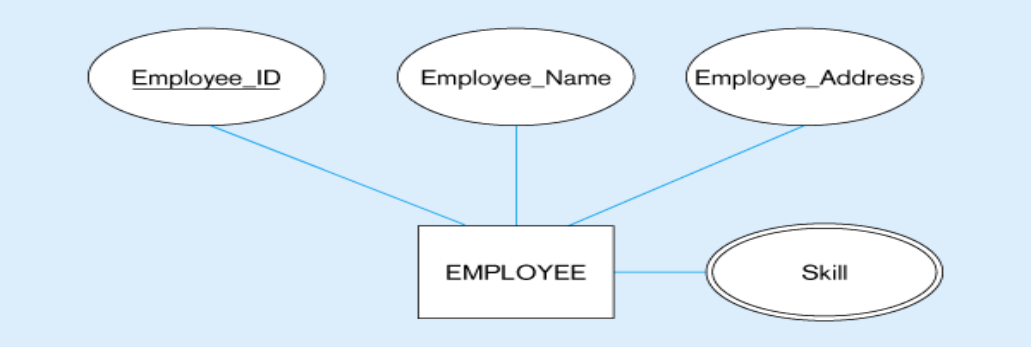
CUSTOMER entity type with simple attributes



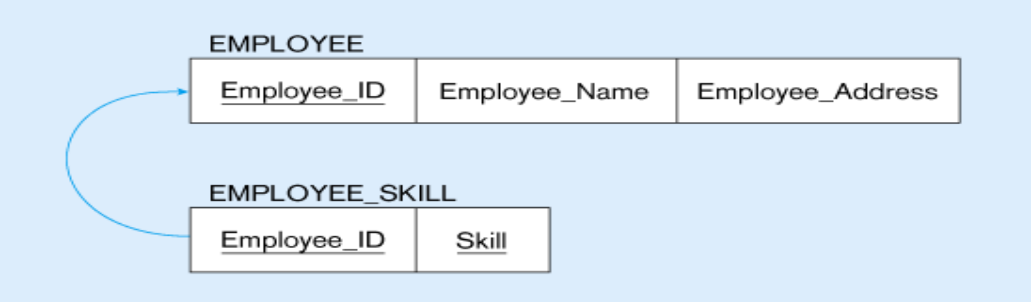
CUSTOMER relation

Converting ER Model to relational schema

Rule 2 - Convert Multivalue attribute



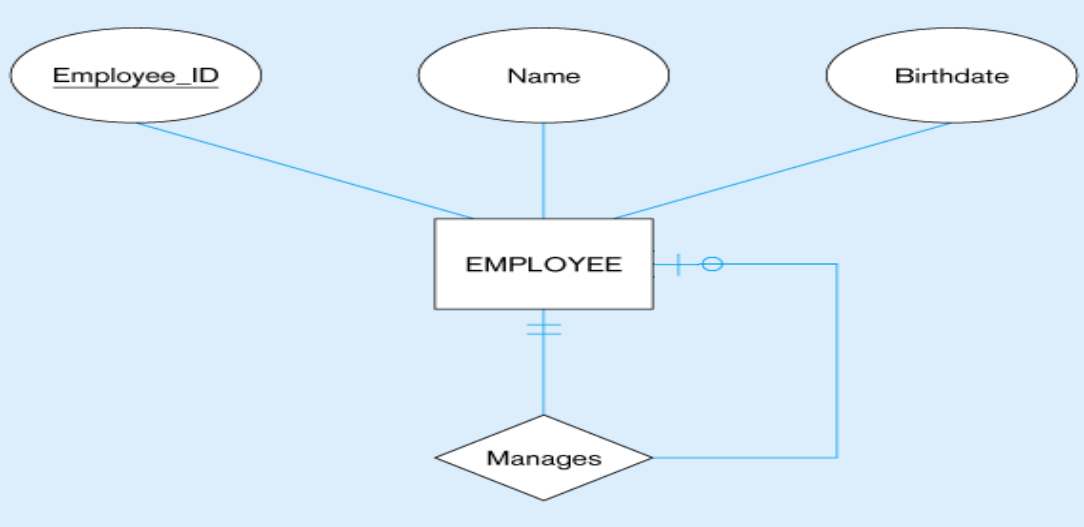
Multivalued attribute becomes a separate relation with foreign key



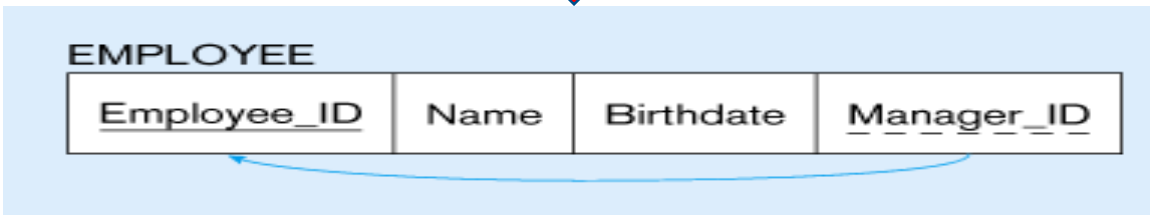
1–to–many relationship between original entity and new relation

Converting ER Model to relational schema

- **Rule 3 - Convert Unary relationship one to one**



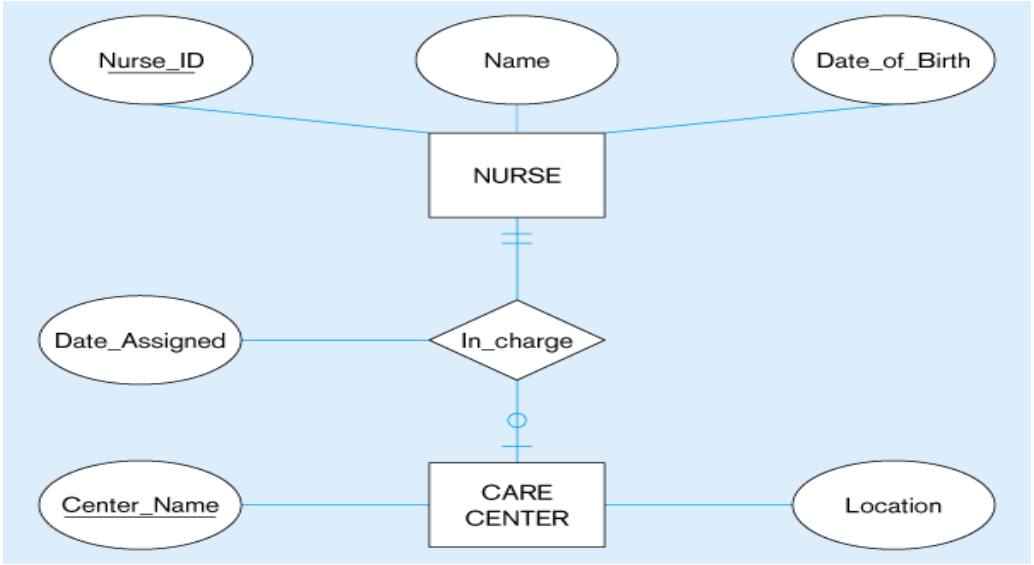
EMPLOYEE entity with Manages relationship



EMPLOYEE relation with recursive foreign key

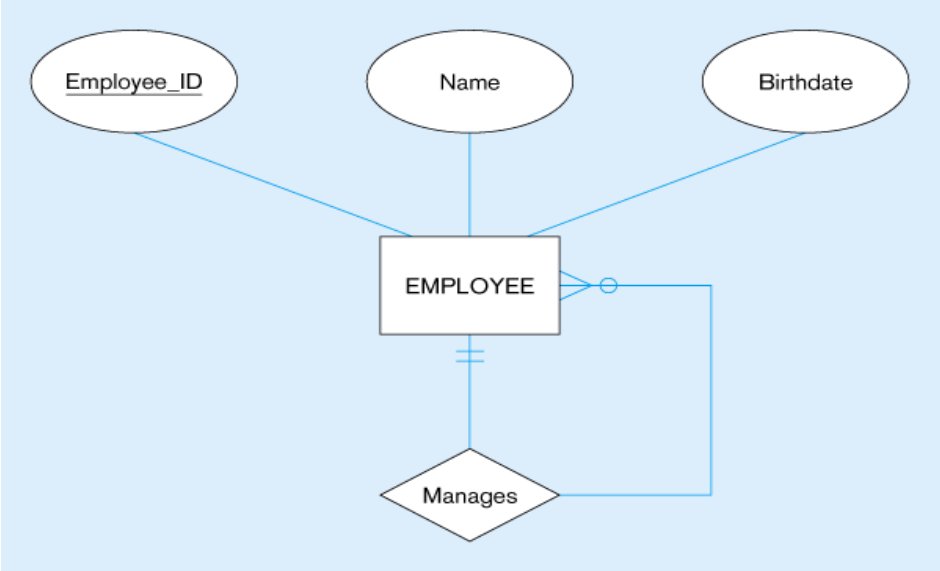
Converting ER Model to relational schema

- **Rule 4 – Convert binary relationship one to one**

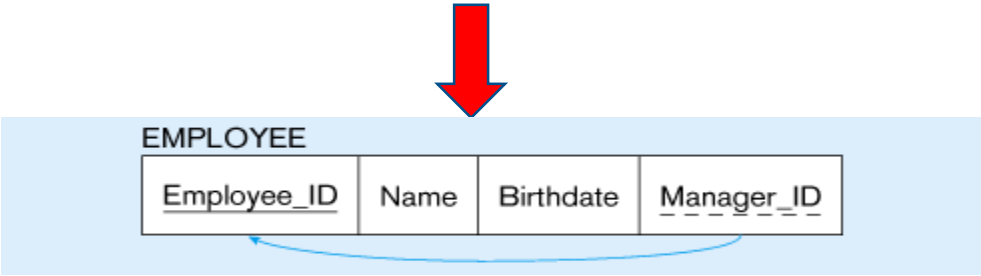


Converting ER Model to relational schema

- **Rule 5 – Convert Unary relationship one to many**



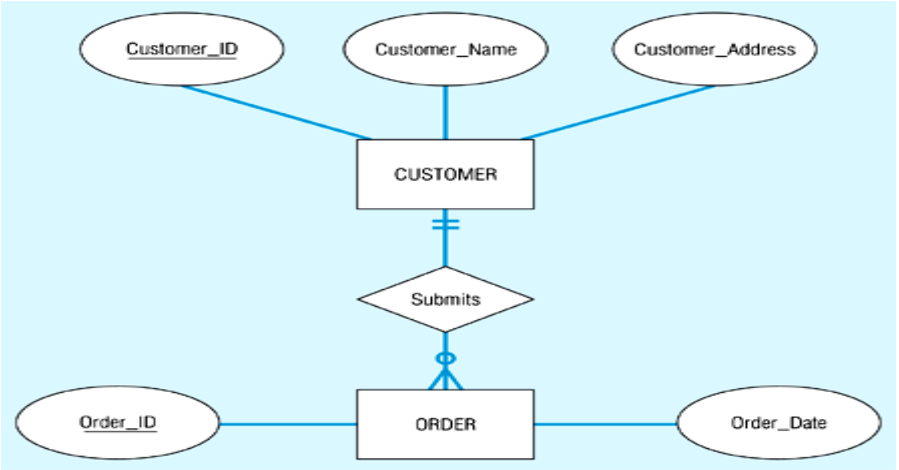
EMPLOYEE entity with Manages relationship



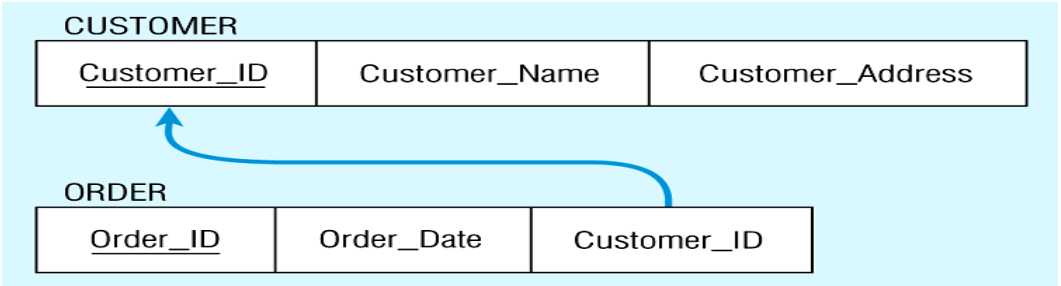
EMPLOYEE relation with recursive foreign key

Converting ER Model to relational schema

- **Rule 6 – Convert Binary relationship one to many**



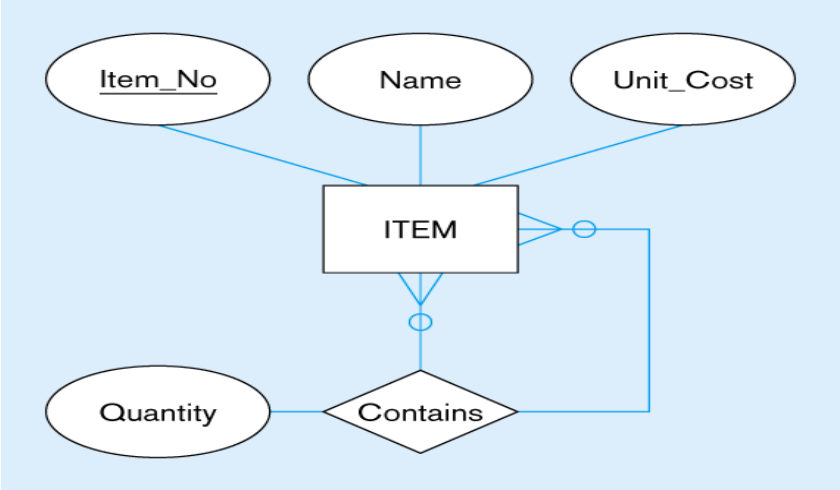
Note the mandatory one



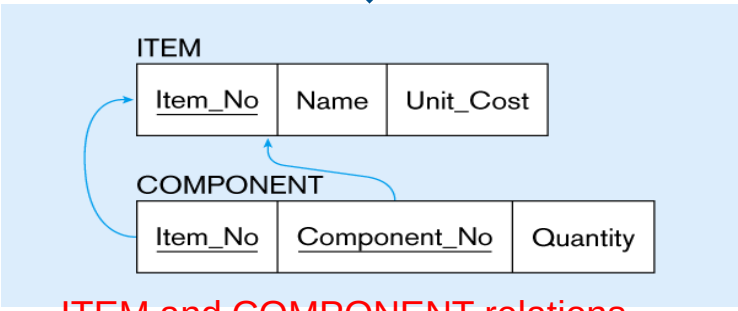
Again, no null value in the foreign key…this is because of the mandatory minimum cardinality

Converting ER Model to relational schema

- **Rule 7 – Convert Unary relationship many to many**



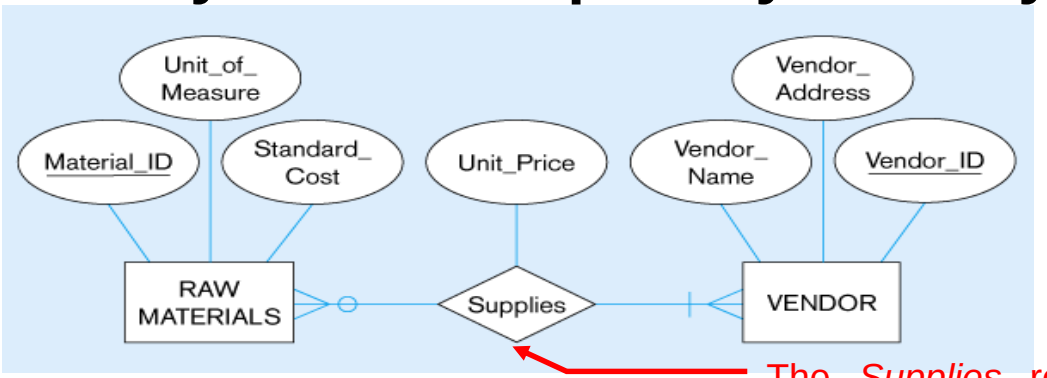
Bill-of-materials relationships (M:N)



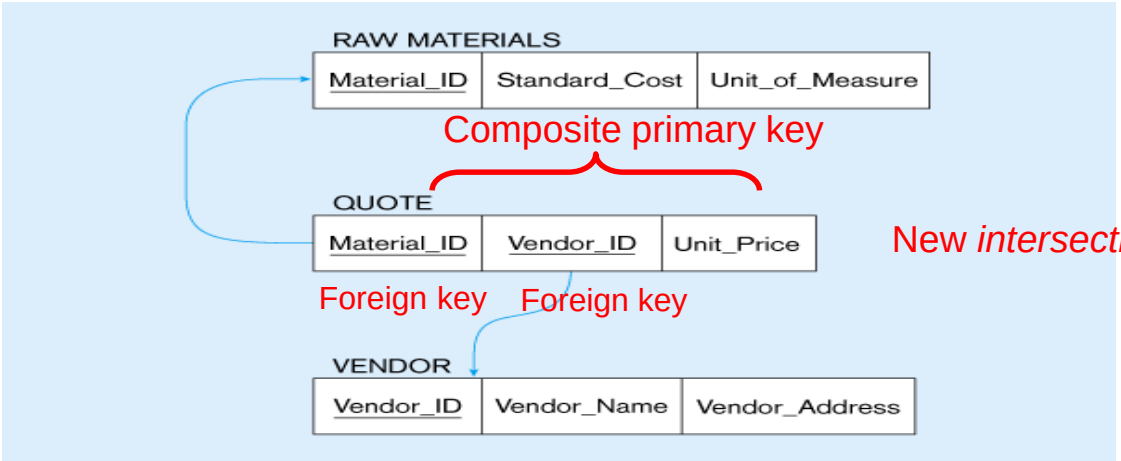
ITEM and COMPONENT relations

Converting ER Model to relational schema

Rule 8 – Convert Binary relationship many to many



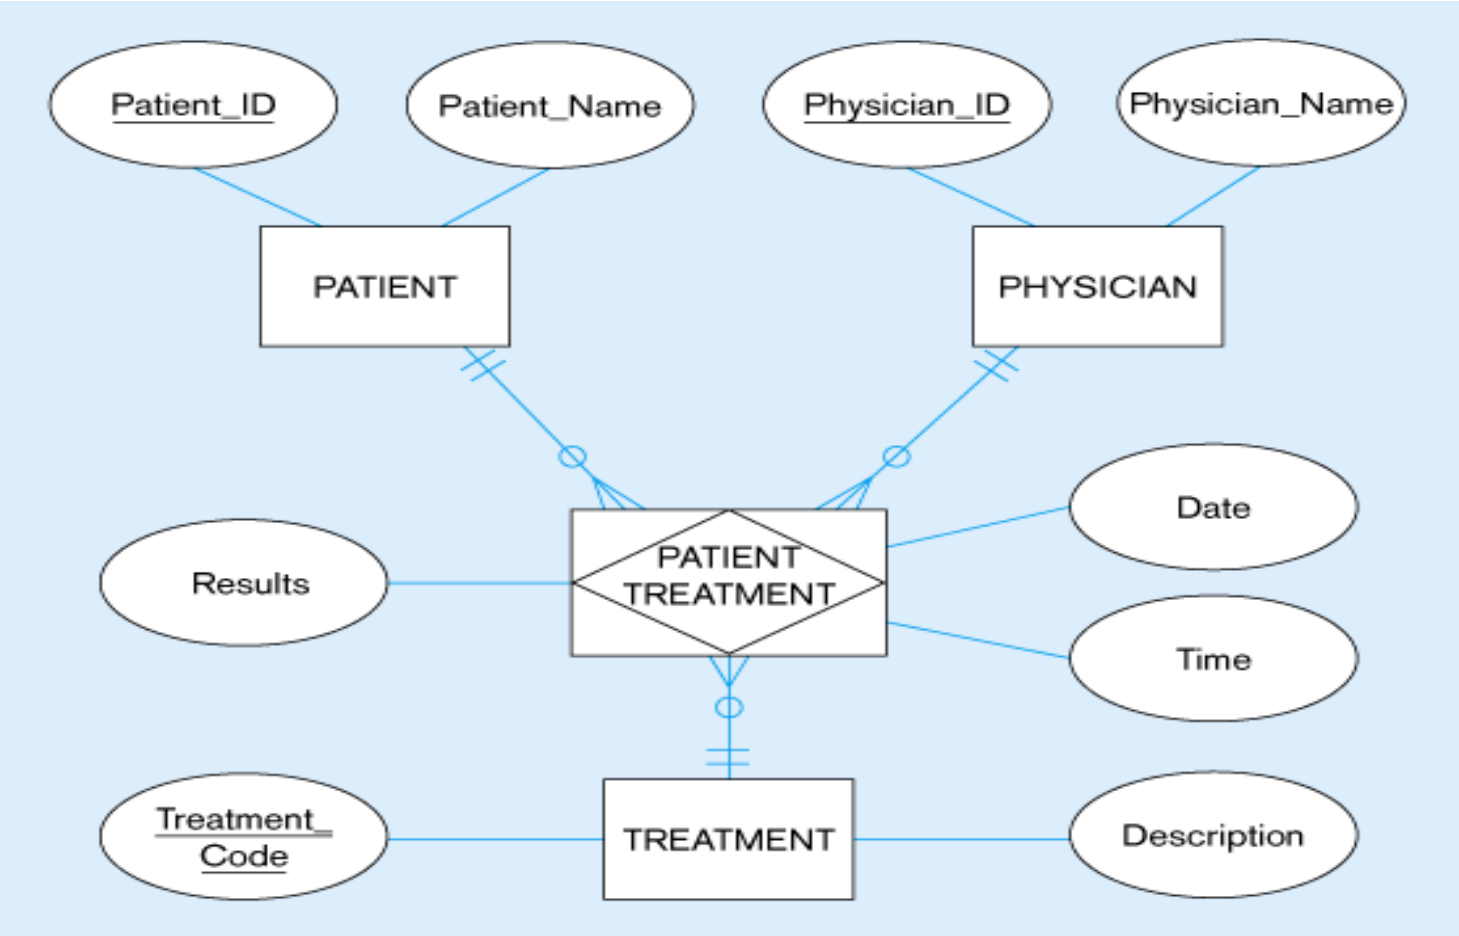
The *Supplies* relationship will need to become a separate relation



New *intersection relation*

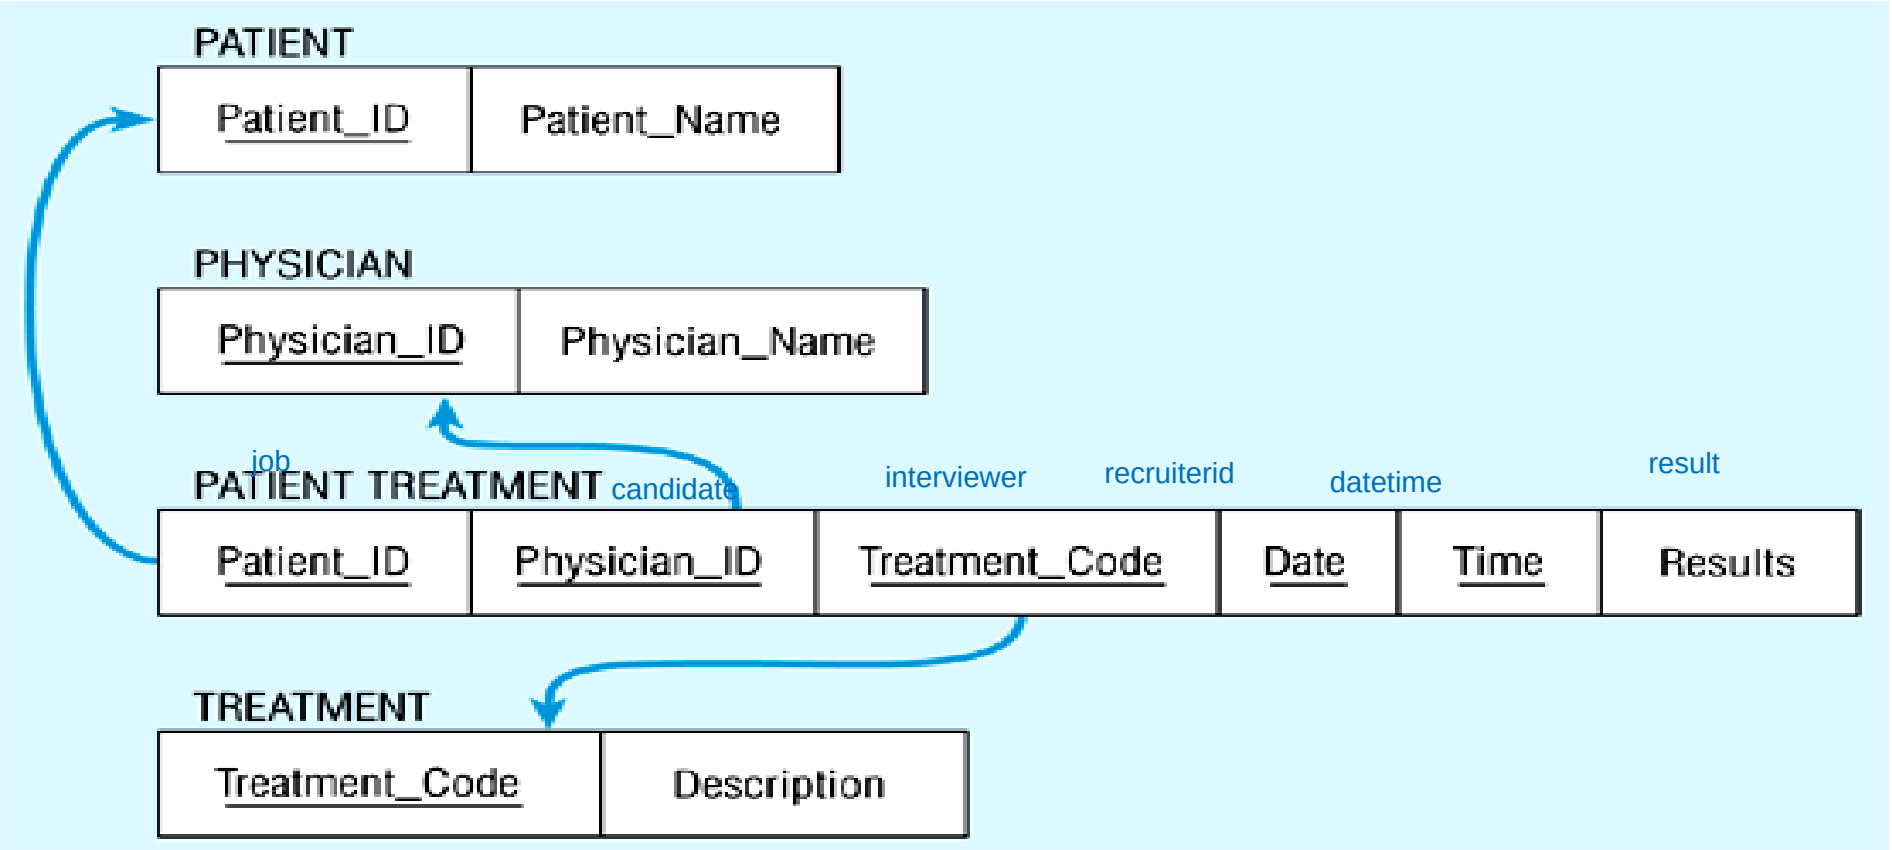
Converting ER Model to relational schema

- **Another - Convert Ternary relationship**



Converting ER Model to relational schema

- **Another- Convert Ternary relationship (2)**



Summary

- SQL Overview
  - ✓SQL, SQL Process, SQL Command
- The Relational Database
  - ✓Table, Field, Record, Schema
- RDBMS Concepts
  - ✓RDBMS, RDBMS vs DBMS
- ER Model
  - ✓Design Process, **Notation,** Converting ER Model to relational schema

THANK YOU!
